

Measles 2007

MEASLES SURVEILLANCE Findings: A total of 30 suspect measles cases were reported and investigated from January-December 2007 in the different sentinel sites in the region. Ten of the cases were positive for IgM antibodies for measles.

Discussion: The figure of suspect measles cases reported and investigated in Region XI doesn't represent the whole measles cases in the region. There are still a number of missed cases in other area which are not reported and documented for the reason that it was not consulted or admitted in the hospital set up.
